

- Petroleum based wax
- 25mm x 25mm box
- Accelerometer mounting

KMPWAX is petrowax supplied by Kemo Ltd for use with accelerometers and other sensor mounting. It is widely used for Modal testing where the user needs to move sensor locations regularly and the application requires limited frequency and amplitude measurements.

Whilst petrowax is a useful tool when using accelerometers for vibration testing, it should be used with great care and consideration of the type of test and results required. Typical limitations to be considered are as follows:

- Should only be used for low frequency measurement
- Can only be used at normal ambient conditions, should never be used for elevated or reduce temperature testing
- Suitable for the mounting of low mass, small size sensors only

Incorrect use can result in poor data accuracy.

Due to continued product development Kemo Limited reserve the right to change specification without notice.
